

PROVISIONAL PATENT SPECIFICATION

SYSTEM AND METHOD FOR DYNAMIC VALUE EXCHANGE BETWEEN DIGITAL CONTENT CREATORS AND BRAND ENTITIES THROUGH ADAPTIVE PERSONA-BASED COMMERCE

Filing Date: 09/04/2026

Applicant: Saketh Velamuri, India

ABSTRACT

A system and method for enabling dynamic value exchange between digital content creators and brand entities through adaptive persona-based commerce.

The invention comprises: (1) a multi-dimensional affinity scoring engine matching creators with brands based on audience demographics, engagement patterns, and

TECHNICAL FIELD

This invention relates to digital commerce systems for facilitating value exchange between content creators and brands through intelligent matching, value quantification, and workflow management on multi-platform networks.

BACKGROUND

- The creator economy exceeds \$20 billion globally with fragmented tools.
- Current influencer platforms lack sophisticated creator-brand matching algorithms.
- Creator value assessment remains largely subjective without quantitative frameworks.
- Multi-platform integration is incomplete, requiring creators to manage separate systems.
- Deal workflows lack standardization, transparency, and efficient progression mechanisms.

DETAILED DESCRIPTION

- Matching Engine: Multi-dimensional vector space algorithms compute affinity scores across 8+ dimensions (audience overlap, engagement, demographics, sentiment, etc.)
- Value Framework: Composite metrics quantify creator assets (follower quality, engagement rates, audience sentiment, historical performance, growth trajectory)
- Workflow State Machine: Manages deal progression through defined states with timeout handling and comprehensive audit trails
- Persona System: Allows creators to optimize presentation for different brands while maintaining core identity and authenticity
- Platform Integration: Unified API abstractions supporting Instagram, YouTube, TikTok, Twitch with standardized data models

CLAIMS (10 Total)

Claim 1 (Independent): A system comprising matching engine, value assessment framework, workflow state machine, and platform abstraction layer.

Claim 2 (Independent): A method for dynamic value exchange comprising: receiving profiles, computing affinity scores, assessing value, managing workflow, and facilitating execution across platforms.

Claims 3-10 (Dependent): Covering specific implementations of matching algorithms, value metrics, workflow states, persona adaptation, and platform integration.
